

Pseudoinstructions follow roughly the same conventions, but omit instruction encoding information. For example:

Multiply (without overflow)

```
mul rdest, rsrcl, src2    pseudoinstruction
```

In pseudoinstructions, `rdest` and `rsrcl` are registers and `src2` is either a register or an immediate value. In general, the assembler and SPIM translate a more general form of an instruction (e.g., `add $v1, $a0, 0x55`) to a specialized form (e.g., `addi $v1, $a0, 0x55`).

Arithmetic and Logical Instructions

Absolute value

```
abs rdest, rsrc    pseudoinstruction
```

Put the absolute value of register `rsrc` in register `rdest`.

Addition (with overflow)

Addition (without overflow)

Put the sum of registers `rs` and `rt` into register `rd`.

Addition immediate (with overflow)

Addition immediate (without overflow)

Put the sum of register `rs` and the sign-extended immediate into register `rt`.

AND

and rd, rs, rt	0	rs	rt	rd	0	0x24
	6	5	5	5	5	6

Put the logical AND of registers *rs* and *rt* into register *rd*.

AND immediate

andi rt, rs, imm	0xc	rs	rt	imm
	6	5	5	16

Put the logical AND of register *rs* and the zero-extended immediate into register *rt*.

Count leading ones

clo rd, rs	0x1c	rs	0	rd	0	0x21
	6	5	5	5	5	6

Count leading zeros

clz rd, rs	0x1c	rs	0	rd	0	0x20
	6	5	5	5	5	6

Count the number of leading ones (zeros) in the word in register *rs* and put the result into register *rd*. If a word is all ones (zeros), the result is 32.

Divide (with overflow)

div rs, rt	0	rs	rt	0	0x1a
	6	5	5	10	6

Divide (without overflow)

divu rs, rt	0	rs	rt	0	0x1b
	6	5	5	10	6

Divide register *rs* by register *rt*. Leave the quotient in register *lo* and the remainder in register *hi*. Note that if an operand is negative, the remainder is unspecified by the MIPS architecture and depends on the convention of the machine on which SPIM is run.

Divide (with overflow)

```
div rdest, rsrcl, src2      pseudoinstruction
```

Divide (without overflow)

```
divu rdest, rsrcl, src2     pseudoinstruction
```

Put the quotient of register `rsrcl` and `src2` into register `rdest`.

Multiply

Unsigned multiply

Multiply registers `rs` and `rt`. Leave the low-order word of the product in register `lo` and the high-order word in register `hi`.

Multiply (without overflow)

Put the low-order 32 bits of the product of `rs` and `rt` into register `rd`.

Multiply (with overflow)

```
mulo rdest, rsrcl, src2     pseudoinstruction
```

Unsigned multiply (with overflow)

```
mulou rdest, rsrcl, src2    pseudoinstruction
```

Put the low-order 32 bits of the product of register `rsrcl` and `src2` into register `rdest`.

Multiply add

madd rs, rt	0x1c	rs	rt	0	0
	6	5	5	10	6

Unsigned multiply add

maddu rs, rt	0x1c	rs	rt	0	1
	6	5	5	10	6

Multiply registers `rs` and `rt` and add the resulting 64-bit product to the 64-bit value in the concatenated registers `lo` and `hi`.

Multiply subtract

msub rs, rt	0x1c	rs	rt	0	4
	6	5	5	10	6

Unsigned multiply subtract

msub rs, rt	0x1c	rs	rt	0	5
	6	5	5	10	6

Multiply registers `rs` and `rt` and subtract the resulting 64-bit product from the 64-bit value in the concatenated registers `lo` and `hi`.

Negate value (with overflow)

neg rdest, rsrc *pseudoinstruction*

Negate value (without overflow)

negu rdest, rsrc *pseudoinstruction*

Put the negative of register `rsrc` into register `rdest`.

NOR

nor rd, rs, rt	0	rs	rt	rd	0	0x27
	6	5	5	5	5	6

Put the logical NOR of registers `rs` and `rt` into register `rd`.

NOT

```
not rdest, rsrc                                pseudoinstruction
```

Put the bitwise logical negation of register `rsrc` into register `rdest`.

OR

Put the logical OR of registers `rs` and `rt` into register `rd`.

OR immediate

Put the logical OR of register `rs` and the zero-extended immediate into register `rt`.

Remainder

```
rem rdest, rsrc1, rsrc2                       pseudoinstruction
```

Unsigned remainder

```
remu rdest, rsrc1, rsrc2                     pseudoinstruction
```

Put the remainder of register `rsrc1` divided by register `rsrc2` into register `rdest`. Note that if an operand is negative, the remainder is unspecified by the MIPS architecture and depends on the convention of the machine on which SPIM is run.

Shift left logical

Shift left logical variable

Shift right arithmetic

sra rd, rt, shamt	0	rs	rt	rd	shamt	3
	6	5	5	5	5	6

Shift right arithmetic variable

sra _v rd, rt, rs	0	rs	rt	rd	0	7
	6	5	5	5	5	6

Shift right logical

srl rd, rt, shamt	0	rs	rt	rd	shamt	2
	6	5	5	5	5	6

Shift right logical variable

srl _v rd, rt, rs	0	rs	rt	rd	0	6
	6	5	5	5	5	6

Shift register *rt* left (right) by the distance indicated by immediate *shamt* or the register *rs* and put the result in register *rd*. Note that argument *rs* is ignored for *sll*, *sra*, and *srl*.

Rotate left

rol rdest, rsrc1, rsrc2 *pseudoinstruction*

Rotate right

ror rdest, rsrc1, rsrc2 *pseudoinstruction*

Rotate register *rsrc1* left (right) by the distance indicated by *rsrc2* and put the result in register *rdest*.

Subtract (with overflow)

sub rd, rs, rt	0	rs	rt	rd	0	0x22
	6	5	5	5	5	6

Subtract (without overflow)

Put the difference of registers `rs` and `rt` into register `rd`.

Exclusive OR

Put the logical XOR of registers `rs` and `rt` into register `rd`.

XOR immediate

Put the logical XOR of register `rs` and the zero-extended immediate into register `rt`.

Constant-Manipulating Instructions

Load upper immediate

Load the lower halfword of the immediate `imm` into the upper halfword of register `rt`. The lower bits of the register are set to 0.

Load immediate

Move the immediate `imm` into register `rdest`.

Comparison Instructions

Set less than

Set less than unsigned

sltu rd, rs, rt	0	rs	rt	rd	0	0x2b
	6	5	5	5	5	6

Set register *rd* to 1 if register *rs* is less than *rt*, and to 0 otherwise.

Set less than immediate

slti rt, rs, imm	0xa	rs	rt	imm
	6	5	5	16

Set less than unsigned immediate

sltiu rt, rs, imm	0xb	rs	rt	imm
	6	5	5	16

Set register *rt* to 1 if register *rs* is less than the sign-extended immediate, and to 0 otherwise.

Set equal

seq rdest, rsrc1, rsrc2 *pseudoinstruction*

Set register *rdest* to 1 if register *rsrc1* equals *rsrc2*, and to 0 otherwise.

Set greater than equal

sge rdest, rsrc1, rsrc2 *pseudoinstruction*

Set greater than equal unsigned

sgeu rdest, rsrc1, rsrc2 *pseudoinstruction*

Set register *rdest* to 1 if register *rsrc1* is greater than or equal to *rsrc2*, and to 0 otherwise.

Set greater than

sgt rdest, rsrc1, rsrc2 *pseudoinstruction*

Set greater than unsigned

`sgtu rdest, rsrc1, rsrc2` *pseudoinstruction*

Set register `rdest` to 1 if register `rsrc1` is greater than `rsrc2`, and to 0 otherwise.

Set less than equal

`sle rdest, rsrc1, rsrc2` *pseudoinstruction*

Set less than equal unsigned

`sleu rdest, rsrc1, rsrc2` *pseudoinstruction*

Set register `rdest` to 1 if register `rsrc1` is less than or equal to `rsrc2`, and to 0 otherwise.

Set not equal

`sne rdest, rsrc1, rsrc2` *pseudoinstruction*

Set register `rdest` to 1 if register `rsrc1` is not equal to `rsrc2`, and to 0 otherwise.

Branch Instructions

Branch instructions use a signed 16-bit instruction *offset* field; hence, they can jump $2^{15} - 1$ instructions (not bytes) forward or 2^{15} instructions backward. The *jump* instruction contains a 26-bit address field. In actual MIPS processors, branch instructions are delayed branches, which do not transfer control until the instruction following the branch (its “delay slot”) has executed (see Chapter 4). Delayed branches affect the offset calculation, since it must be computed relative to the address of the delay slot instruction ($PC + 4$), which is when the branch occurs. SPIM does not simulate this delay slot, unless the `-bare` or `-delayed_branch` flags are specified.

In assembly code, offsets are not usually specified as numbers. Instead, an instructions branch to a label, and the assembler computes the distance between the branch and the target instructions.

In MIPS-32, all actual (not pseudo) conditional branch instructions have a “likely” variant (for example, `beq`’s likely variant is `beql`), which does *not* execute the instruction in the branch’s delay slot if the branch is not taken. Do not use

these instructions; they may be removed in subsequent versions of the architecture. SPIM implements these instructions, but they are not described further.

Branch instruction

b label *pseudoinstruction*

Unconditionally branch to the instruction at the label.

Branch coprocessor false

bclf cc label

0x11	8	cc	0	Offset
6	5	3	2	16

Branch coprocessor true

bclt cc label

0x11	8	cc	1	Offset
6	5	3	2	16

Conditionally branch the number of instructions specified by the offset if the floating-point coprocessor’s condition flag numbered *cc* is false (true). If *cc* is omitted from the instruction, condition code flag 0 is assumed.

Branch on equal

beq rs, rt, label

4	rs	rt	Offset
6	5	5	16

Conditionally branch the number of instructions specified by the offset if register *rs* equals *rt*.

Branch on greater than equal zero

bgez rs, label

1	rs	1	Offset
6	5	5	16

Conditionally branch the number of instructions specified by the offset if register *rs* is greater than or equal to 0.

Branch on greater than equal zero and link

Conditionally branch the number of instructions specified by the offset if register `rs` is greater than or equal to 0. Save the address of the next instruction in register 31.

Branch on greater than zero

Conditionally branch the number of instructions specified by the offset if register `rs` is greater than 0.

Branch on less than equal zero

Conditionally branch the number of instructions specified by the offset if register `rs` is less than or equal to 0.

Branch on less than and link

Conditionally branch the number of instructions specified by the offset if register `rs` is less than 0. Save the address of the next instruction in register 31.

Branch on less than zero

Conditionally branch the number of instructions specified by the offset if register `rs` is less than 0.

Branch on not equal

Conditionally branch the number of instructions specified by the offset if register `rs` is not equal to `rt`.

Branch on equal zero

beqz rsrc, label

pseudoinstruction

Conditionally branch to the instruction at the label if `rsrc` equals 0.

Branch on greater than equal

bge rsrc1, rsrc2, label

pseudoinstruction

Branch on greater than equal unsigned

bgeu rsrc1, rsrc2, label

pseudoinstruction

Conditionally branch to the instruction at the label if register `rsrc1` is greater than or equal to `rsrc2`.

Branch on greater than

bgt rsrc1, src2, label

pseudoinstruction

Branch on greater than unsigned

bgtu rsrc1, src2, label

pseudoinstruction

Conditionally branch to the instruction at the label if register `rsrc1` is greater than `src2`.

Branch on less than equal

ble rsrc1, src2, label

pseudoinstruction

Branch on less than equal unsigned

```
bleu rsrc1, src2, label           pseudoinstruction
```

Conditionally branch to the instruction at the label if register `rsrc1` is less than or equal to `src2`.

Branch on less than

```
blt rsrc1, rsrc2, label           pseudoinstruction
```

Branch on less than unsigned

```
bltu rsrc1, rsrc2, label          pseudoinstruction
```

Conditionally branch to the instruction at the label if register `rsrc1` is less than `rsrc2`.

Branch on not equal zero

```
bnez rsrc, label                  pseudoinstruction
```

Conditionally branch to the instruction at the label if register `rsrc` is not equal to 0.

Jump Instructions

Jump

Unconditionally jump to the instruction at target.

Jump and link

Unconditionally jump to the instruction at target. Save the address of the next instruction in register `$ra`.

Jump and link register

Unconditionally jump to the instruction whose address is in register *rs*. Save the address of the next instruction in register *rd* (which defaults to 31).

Jump register

Unconditionally jump to the instruction whose address is in register *rs*.

Trap Instructions

Trap if equal

If register *rs* is equal to register *rt*, raise a Trap exception.

Trap if equal immediate

If register *rs* is equal to the sign-extended value *imm*, raise a Trap exception.

Trap if not equal

If register *rs* is not equal to register *rt*, raise a Trap exception.

Trap if not equal immediate

If register *rs* is not equal to the sign-extended value *imm*, raise a Trap exception.

Trap if greater equal

Unsigned trap if greater equal

If register *rs* is greater than or equal to register *rt*, raise a Trap exception.

Trap if greater equal immediate

Unsigned trap if greater equal immediate

If register *rs* is greater than or equal to the sign-extended value *imm*, raise a Trap exception.

Trap if less than

Unsigned trap if less than

If register *rs* is less than register *rt*, raise a Trap exception.

Trap if less than immediate

Unsigned trap if less than immediate

If register `rs` is less than the sign-extended value `imm`, raise a Trap exception.

Load Instructions

Load address

Load computed *address*—not the contents of the location—into register `rdest`.

Load byte

Load unsigned byte

Load the byte at *address* into register `rt`. The byte is sign-extended by `lb`, but not by `lbu`.

Load halfword

Load unsigned halfword

Load the 16-bit quantity (halfword) at *address* into register `rt`. The halfword is sign-extended by `lh`, but not by `lhu`.

Load word

Load the 32-bit quantity (word) at *address* into register *rt*.

Load word coprocessor 1

Load the word at *address* into register *ft* in the floating-point unit.

Load word left

Load word right

Load the left (right) bytes from the word at the possibly unaligned *address* into register *rt*.

Load doubleword

Load the 64-bit quantity at *address* into registers *rdest* and *rdest + 1*.

Unaligned load halfword

Unaligned load halfword unsigned

```
ulhu rdest, address pseudoinstruction
```

Load the 16-bit quantity (halfword) at the possibly unaligned *address* into register *rdest*. The halfword is sign-extended by *ulh*, but not *ulhu*.

Unaligned load word

```
ulw rdest, address pseudoinstruction
```

Load the 32-bit quantity (word) at the possibly unaligned *address* into register *rdest*.

Load linked

Load the 32-bit quantity (word) at *address* into register *rt* and start an atomic read-modify-write operation. This operation is completed by a store conditional (*sc*) instruction, which will fail if another processor writes into the block containing the loaded word. Since SPIM does not simulate multiple processors, the store conditional operation always succeeds.

Store Instructions

Store byte

Store the low byte from register *rt* at *address*.

Store halfword

Store the low halfword from register *rt* at *address*.

Store word

Store the word from register *rt* at *address*.

Store word coprocessor 1

Store the floating-point value in register *ft* of floating-point coprocessor at *address*.

Store double coprocessor 1

Store the doubleword floating-point value in registers *ft* and *ft + 1* of floating-point coprocessor at *address*. Register *ft* must be even numbered.

Store word left

Store word right

Store the left (right) bytes from register *rt* at the possibly unaligned *address*.

Store doubleword

Store the 64-bit quantity in registers *rsrc* and *rsrc + 1* at *address*.

Unaligned store halfword

```
ush rsrc, address pseudoinstruction
```

Store the low halfword from register `rsrc` at the possibly unaligned *address*.

Unaligned store word

```
usw rsrc, address pseudoinstruction
```

Store the word from register `rsrc` at the possibly unaligned *address*.

Store conditional

Store the 32-bit quantity (word) in register `rt` into memory at *address* and complete an atomic read-modify-write operation. If this atomic operation is successful, the memory word is modified and register `rt` is set to 1. If the atomic operation fails because another processor wrote to a location in the block containing the addressed word, this instruction does not modify memory and writes 0 into register `rt`. Since SPIM does not simulate multiple processors, the instruction always succeeds.

Data Movement Instructions

Move

```
move rdest, rsrc pseudoinstruction
```

Move register `rsrc` to `rdest`.

Move from hi

Move from lo

mflo rd	0	0	rd	0	0x12
	6	10	5	5	6

The multiply and divide unit produces its result in two additional registers, `hi` and `lo`. These instructions move values to and from these registers. The multiply, divide, and remainder pseudoinstructions that make this unit appear to operate on the general registers move the result after the computation finishes.

Move the `hi` (`lo`) register to register `rd`.

Move to hi

mthi rs	0	rs	0	0x11
	6	5	15	6

Move to lo

mtlo rs	0	rs	0	0x13
	6	5	15	6

Move register `rs` to the `hi` (`lo`) register.

Move from coprocessor 0

mfc0 rt, rd	0x10	0	rt	rd	0
	6	5	5	5	11

Move from coprocessor 1

mfc1 rt, fs	0x11	0	rt	fs	0
	6	5	5	5	11

Coprocessors have their own register sets. These instructions move values between these registers and the CPU's registers.

Move register `rd` in a coprocessor (register `fs` in the FPU) to CPU register `rt`. The floating-point unit is coprocessor 1.

Move double from coprocessor 1

`mfcd.d rdest, frsrcl` *pseudoinstruction*

Move floating-point registers `frsrcl` and `frsrcl + 1` to CPU registers `rdest` and `rdest + 1`.

Move to coprocessor 0

`mtc0 rd, rt`

0x10	4	rt	rd	0
6	5	5	5	11

Move to coprocessor 1

`mtc1 rd, fs`

0x11	4	rt	fs	0
6	5	5	5	11

Move CPU register `rt` to register `rd` in a coprocessor (register `fs` in the FPU).

Move conditional not zero

`movn rd, rs, rt`

0	rs	rt	rd	0xb
6	5	5	5	11

Move register `rs` to register `rd` if register `rt` is not 0.

Move conditional zero

`movz rd, rs, rt`

0	rs	rt	rd	0xa
6	5	5	5	11

Move register `rs` to register `rd` if register `rt` is 0.

Move conditional on FP false

`movf rd, rs, cc`

0	rs	cc	0	rd	0	1
6	5	3	2	5	5	6

Move CPU register `rs` to register `rd` if FPU condition code flag number `cc` is 0. If `cc` is omitted from the instruction, condition code flag 0 is assumed.

Move conditional on FP true

movt rd, rs, cc	0	rs	cc	1	rd	0	1
	6	5	3	2	5	5	6

Move CPU register *rs* to register *rd* if FPU condition code flag number *cc* is 1. If *cc* is omitted from the instruction, condition code bit 0 is assumed.

Floating-Point Instructions

The MIPS has a floating-point coprocessor (numbered 1) that operates on single precision (32-bit) and double precision (64-bit) floating-point numbers. This coprocessor has its own registers, which are numbered \$f0-\$f31. Because these registers are only 32 bits wide, two of them are required to hold doubles, so only floating-point registers with even numbers can hold double precision values. The floating-point coprocessor also has eight condition code (*cc*) flags, numbered 0–7, which are set by compare instructions and tested by branch (*bcl f* or *bcl t*) and conditional move instructions.

Values are moved in or out of these registers one word (32 bits) at a time by *lwcl*, *swcl*, *mtcl*, and *mfcl* instructions or one double (64 bits) at a time by *ldcl* and *sdcl*, described above, or by the *l.s*, *l.d*, *s.s*, and *s.d* pseudoinstructions described below.

In the actual instructions below, bits 21–26 are 0 for single precision and 1 for double precision. In the pseudoinstructions below, *fdest* is a floating-point register (e.g., \$f2).

Floating-point absolute value double

abs.d fd, fs	0x11	1	0	fs	fd	5
	6	5	5	5	5	6

Floating-point absolute value single

abs.s fd, fs	0x11	0	0	fs	fd	5
--------------	------	---	---	----	----	---

Compute the absolute value of the floating-point double (single) in register *fs* and put it in register *fd*.

Floating-point addition double

add.d fd, fs, ft	0x11	0x11	ft	fs	fd	0
	6	5	5	5	5	6
